Session 4

Interpretation of drawings, music scores, tables, etc.

Chairs

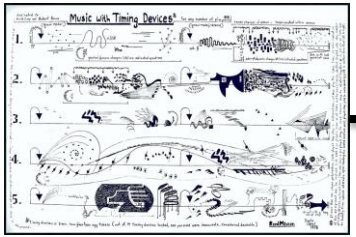
Mickaël Coustaty (L3I, Université de La Rochelle)
Véronique Eglin (LIRIS, INSA de Lyon)

Short presentation of chairs

- **Véronique Eglin**
  - Professor @ LIRIS (INSA de Lyon)
  - Handwriting analysis, word-spotting, writer identification, retrieval
  - Digital Humanities / Historical documents

- **Mickaël Coustaty**
  - Associate Professor @ L3i (University of La Rochelle)
  - Indexing of graphics in historical documents
  - Digital Humanities / Fraud Detection and Forensics

Context of graphical content interpretation



Detection
- Basic constitutive elements
- Primitives

GT#1

Composition rules
- Strings
- Cells
- Note composition

GT#2

Semantic labelling
- Hierarchical classification
- Recomposing

GT#3

Interpretating
- Transcription
- Context oriented

GT#4

Needs and open problems

- **Needs**:
  - More genericity in the detection and recognition steps
  - User knowledge in the process loop
- **Main tasks**:
  - The detection of basic constitutive elements / primitives (text, beams, note-head, stems, boxes)
  - The recognition of degraded symbols, distorted plans
  - The ground truth generation and the annotation of datasets
- **Current status**: no generic methodologies for drawing interpretation (tables, architectural plans, music scores)
- **Open problems** (not yet solved): efficient solutions with unbalanced data, high-level of heterogeneity and low quality of data, no efficient annotated datasets, no fair solution for mobility

Paper 1

Camera-based Optical Music Recognition using a Convolutional Neural Network

Adria Rico, Alicia Fornès, CVC Barcelona

- Need for a **robust and accurate camera-based OMR** system dedicated to mobile-captured music scores.
- Proposition based on a **neural architecture using a CNN** for music symbols classification, exploration of deep features to improve low quality images.
- A proposition that relies on the **automatic generation of ground-truth** images

Paper 2

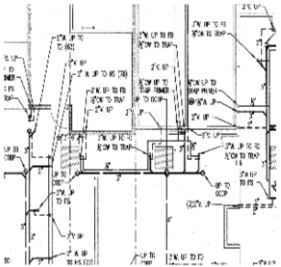
Music Document Layout Analysis through Machine Learning and Human Feedback

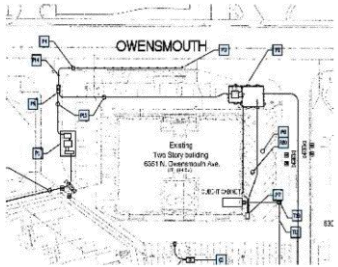
Jorge Calvo-Zaragoza, Ke Zhang, Zeyad Saleh, Gabriel Vigliensoni and Ichiro Fujinaga

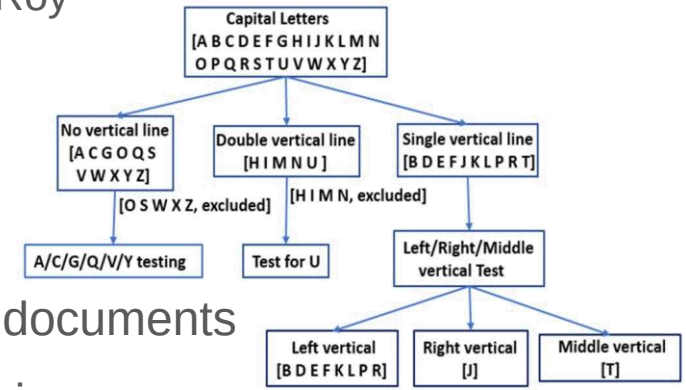
- An answer to overcome the **lack of genericity** of analysis systems that must be redesigned when working with different sources of data
  - before the step of symbols recognition
  - in a context of historical and/or real datasets (containing a high level of heterogeneity)
- Contribution to a **user-aided classification scheme** to segment efficiently categories of music scores elements and validated by a quantification of user's effort

Paper 3 Automatic Orientation Correction of AEC Drawing Documents

Bhagesh Seraogi, Supriya Das, Purnendu Banerjee, Bidyut Chaudhuri, Himadri Majumdar, Srinivas Mukkamala, Rahul Roy







- Work on Architectural, Engineering, Construction documents
- Documents composed of texts and graphical drawings
- Need to detect skew/orientation to increase OCR system
- Propose an approach to detect and correct the orientation using new features

Paper 4 Interpreting data from scanned tables

Waleed Farrukh, Antonio Foncubierta-Rodriguez, Anca-Nicoleta Ciubotaru, Guillaume Jaume, Costas Bekas, Orcun Goksel, Maria Gabrani

- Work on table interpretation
- Extract basic objects of tables (characters, line segments)
- Conversion to table specific structural elements (strings, cells)
- Classification of table content (data vs headers)
- Extract the structure of the header cells (interpretation)
- First work on interpretation of tables

Discussion and open questions

- **Contextualisation of the symbol recognition to improved interpretation**
  - Ex: Instead of training on individual segmented symbols without context, what about the direct translation of full lines of sheet music?
- **Dataset and ground-truth** : large corpora of sufficiently diverse annotated symbols are difficult and expensive to produce
  - Are deep architectures new promising solutions for graphics/symbols recognition ? For music scores are they compatible with inherent constraints : unbalanced data, regular and irregular data, unlabelled datasets…?
  - How to reduce the data requirement for training (when not available) ?
- **User-interactions: expert or non-expert ?**
  - What about the role of “expert” user to help the recognition system ? (ex of musicologists in the critical steps of validation of grouping hypothesis, of pruning of non relevant combination of compound notes…)
